

# Exercise

- In pairs, think for a moment about how you would code a program that writes the multiplication table of a given number.
- We need a class with a `main()`, a `Scanner`, two `int` variables, and a `for` loop.

Start

```
int n = enter a number  
int i = 1
```

End

```
import java.util.Scanner;  
class Main {  
    public static void main(String[] args) {  
        Scanner input = new Scanner(System.in);  
        System.out.println("Please insert a number:");  
        int n = Integer.parseInt(input.next());  
  
    }  
}
```
